Foregone Tax Revenues from U.S. Federal Renewable Electricity Production Credits

(Other == Biomass, Municipal Solid Waste)

Analysis Based on JCT & CRS Data

@EPRINC_DC

Through 2024, the U.S. Congressional Joint Committee on Taxation (JCT) projects that foregone tax revenues for renewable PTCs will be \$46.7 billion, of which \$41.4 billion will be for wind.

Foregone Tax Revenues from U.S. Federal Renewable Electricity Production Credits

- **Foregoing tax revenues, the U.S. has been providing production tax credits (PTCs) for various energy-generating initiatives for a long time.**
- **Beginning in 1992, the U.S. Congress has passed, enhanced, and renewed legislation in order to provide PTCs to renewable energy sources. Wind-sourced energy has been the primary beneficiary of these policies and legislation. Some PTCs are indefinite, but most are scheduled to lapse if not renewed.**
- **Since 2008 and projected through 2024, the U.S. Congressional Joint Committee on Taxation (JCT) estimates that foregone tax revenues for renewable PTCs will be \$46.7 billion of which \$41.4 billion will be for wind.**
- **PTCs are important to the growth and development of renewable energy. But they reduce the average cost of electricity, increase demand, and counter energy-efficiency and emissions-reduction objectives.**
- **From 2008 to the present, U.S. wind capacity has risen from 24,600 megawatts to 118,400, or 2.4% to 9.8% of total. In the same period, wind generation rose from 55,400 thousand megawatt hours to 337,500, or from 1.3% to 8.4% of total.**
