Comparing California Solar Generation During the 2022-2023 Pineapple Express

Comparing California Solar Generation During the 2022-2023 Pineapple Express

Comparing California Solar Generation During the 2022-2023 Pineapple Express

- Once or twice over the course of a decade during the months of December and January, large-scale flows of warm
 moist air and associated heavy precipitation deluge the Western United States, specifically California.
- Dubbed the "Pineapple Express" because of its origins near Hawaii, this meteorological phenomenon generally leads to large amounts of extended rainfall and snowfall across a large landscape that is typically arid.
- From December 26, 2022, through January 17, 2023, the Pineapple Express returned. Communities such as Santa Cruz, California received 36.18 inches of rain whereas 12 inches is normal for the combined months of December and January. Heavy snowfall took place across the Sierra Nevadas, including 47 inches at Tahoe City.
- Installed utility-scale solar generation capacity in California is formidable at 15,500 megawatts, more than any
 other state. However, capacity utilization is considerably diminished in December and January, dropping to 15%
 even when sunlight is available for the full duration of the shortened days.
- Where California generated an average of 8.5 thousand megawatts at midday (or between 40% to 52% of total generation) in the 2021-2022 period, this average was 6.9 thousand megawatt hours (or between 20% to 40% of generation) during the 2022-2023 Pineapple Express.
