Breakdown of California Gasoline Prices

- California has implemented a variety of programs unique to the state. Primarily with environmental goals, some of these programs have been effective; others are contentious and questionable. Nevertheless, they have added substantial cost to the state's price of gasoline.
- Historically, the price of California's gasoline has exceeded that of the national average; This is attributable to several factors.
- With California's aggressive moves to contain motor vehicle pollution that began in the 1960s, California authorities targeted gasoline formulations as one channel for mitigation. Given that California wanted to exceed national EPA requirements, California stipulated its own gasoline formulation, sometimes named “reformulated,” more often referred to as CARBOB (California Air Resources Blendstock for Oxygenate Blending).
- The only source for CARBOB is California in-state refiners. By the early 2000s, CARBOB caused California gasoline to be 16 cents higher on average than U.S. gasoline prices.
- In 2006, legislative bill AB32 was signed into law mandating California's Cap & Trade program (California's primary policy for reducing greenhouse gas emissions statewide. In 2011, California's LCFS (Low Carbon Fuel Standard) was implemented. Both environmental programs together have raised California's gasoline prices: in 2004, by an additional 10 cents per gallon; in 2024, by an additional 52 cents.
- ... continuing ...

Breakdown of California Gasoline Prices

- California's excise tax has also contributed the state's gasoline price: in 2000, it was 18 cents per gallon; by 2024, it had risen to 58 cents per gallon.
- All combined, the premium of California's gasoline price over the national gasoline price reached an average high of \$1 during 2022 and 2023 with an all-time peak of \$1.91 per gallon on October 3, 2022. During 2024, it has been 90 cents per gallon.
